

Why PLC?

- 1) Elimination of most data cables – simpler, less prone to problems.
- 2) Weatherproofing much easier – no data cables means sealed controllers.
- 3) For lower channel count traditional LED lighting, one network and 14 amps is enough for most home displays.

Think in terms of traditional LED strings around windows, doors, on bushes etc. with some CCBs for impact. You just plug everything into extension cords and use one Injector.
